

Zomato Order Payment - 3 Tier Architecture

This diagram represents the 3-tier architecture used in a food delivery payment system like Zomato.

Presentation Layer: Handles user interaction such as selecting food, reviewing orders, and placing payments through the app.

Application Layer: Processes business logic including authentication, order creation, and communication with payment gateways. It determines whether a payment is successful or failed.

Data Layer: Stores all relevant data such as user details, order records, payment transactions, and logs. It ensures persistence and reliability of the system.

Flow Summary: The user places an order, the backend validates and processes it, the payment gateway confirms the transaction, and the system updates the order status accordingly.
