

3-tier architecture for Zomato application

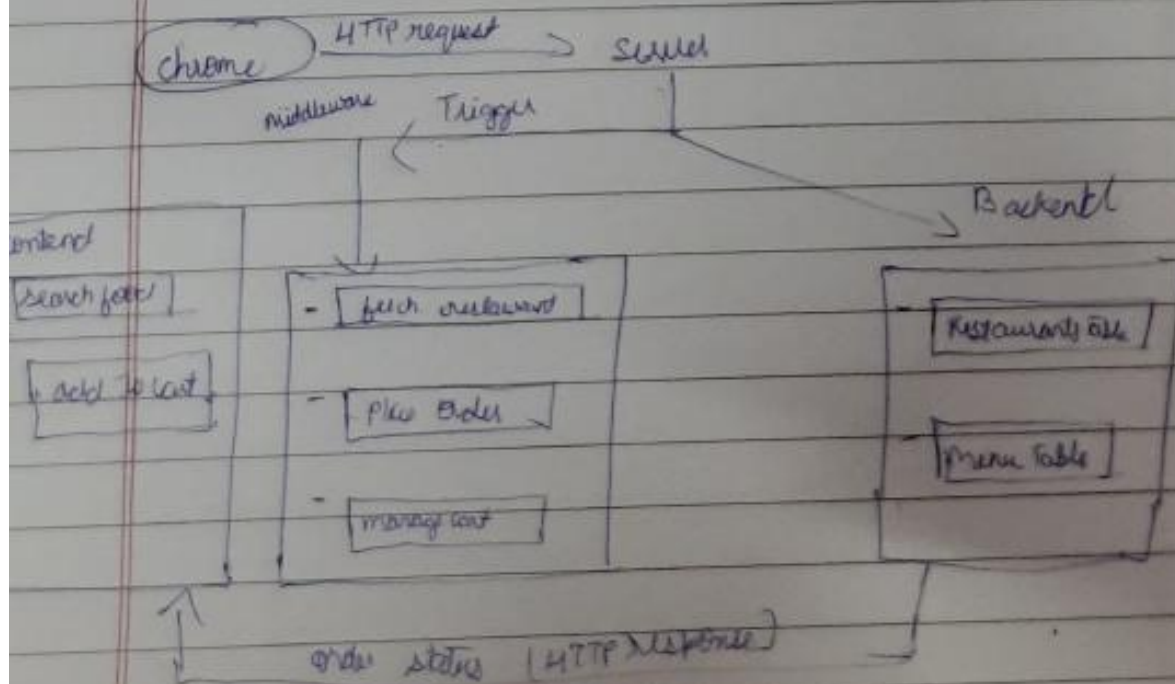

This login is responsible for authenticating users before allowing access to the system.

- Customer Side: This side allows the users to browse, select and order items

frontend - displays restaurant menus and cart options

middleware - process user action such as searching, filtering and placing orders.

Backend - stores restaurant details, menu items and order information

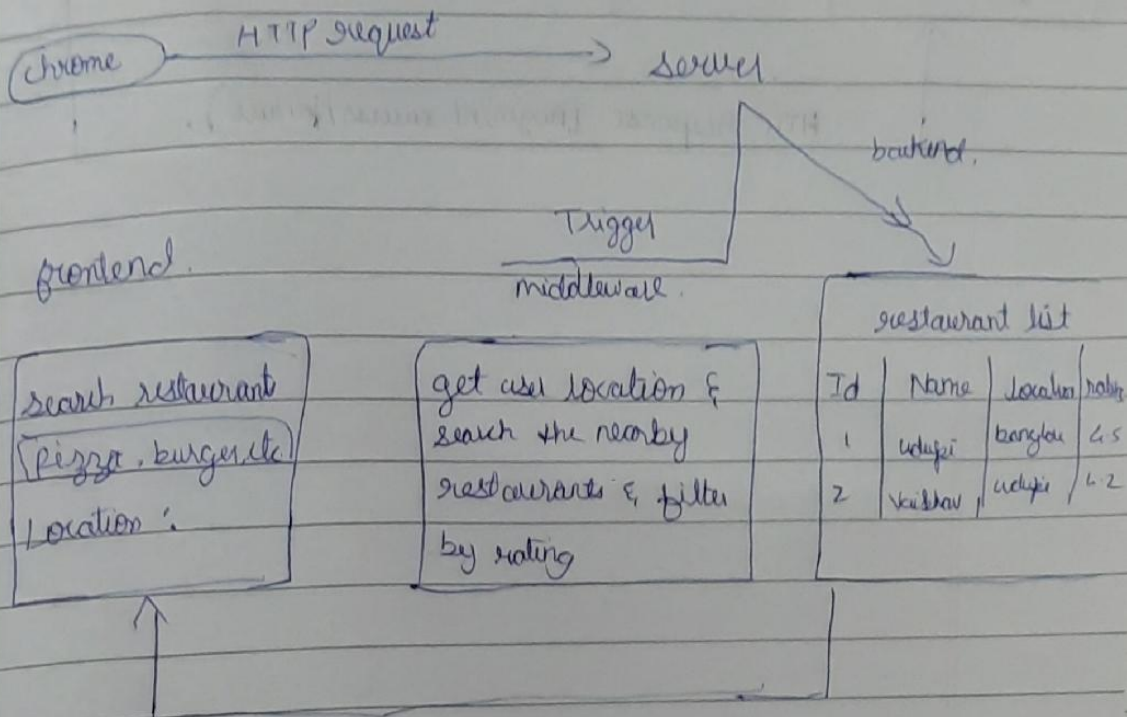

Restaurant side

This enables the restaurant owners to manage their services and orders

frontend - provides dashboard to add remove restaurant update menu and view orders.

middleware - accepting or rejecting order.

backend - stores restaurant profiles, menus and order records.

Payment side

This allows to handle secure transaction processing

frontend - allows users to enter payment details

middleware - validates the request and communicates with external payment services.

backend - records transaction details and payment status.

if successful - payment confirmation is shown
if failed - error message is displayed.
