

□

When user enters the credentials, the browser sends a HTTP request to the server through the middleware. If the credentials are correct, the homepage.html page will be displayed; if wrong, an error page is displayed. Similarly, in the orders UI, when the user presses the order button, the request is sent and validated by the server, and a response is sent back to the frontend through the server and middleware. After the order API call, it is redirected to the payments page. As soon as the pay button is pressed, the request is sent and validated based on the rules defined in the logic, and a response is returned from the server to the frontend UI. The server has a database with fields user and pass to check the data of username and password and can also contain the data about orders. The payments server has a database with fields user, pass, and status of payment processed.
